

Patient Safety

Reduces risk of CO₂ rebreathing

- During exhalation, the mask openings allow expired carbon dioxide to escape at flows as low as 1 LPM

Respond to patients changing oxygen needs faster

- Clinician's time can be utilized for better focused care as oxygen flow can now be quickly titrated to meet the patient's needs without changing delivery devices

Reduces risk of aspiration

- Open mask design minimizes the potential of emesis being aspirated

Uninterrupted oxygen therapy

- Patient communication, care and oral based therapies are possible without removing the mask and interrupting delivery of oxygen

Reduces risk of contamination and equipment set up error

- By using one OxyMask™ vs. multiple devices, the bedside "clutter" is minimized

Does not contain any natural rubber latex or Phthalates such as DEHP

- Minimizes potential for allergic response. (Excluding OxyArm and OxyChin, which are not free of phthalates)
